KUBECON NA 2026 · KUBEVELA

KubeVela 1.12

Applications stop carrying copies of values they do not own. Workflows stop growing with the inventory.

v1.12.0-alpha.1 · nine features, each with a runnable demo

VelaUX 01

New layout, application page, graphs, loops in the studio and reports.

Sources ALPHA 02

Pull in values the app does not own: a ConfigMap, a Git file, a URL.

CEL expressions ALPHA 03

`$( ... )` in any string property, evaluated at render time.

Workflow loops 04

`forEach` runs a step once per item, with per-item status and restart.

Declarative addons ALPHA 05

Install addons as `type: addon` components, in order, from Git.

Native Helm 06

The built-in `helmchart` component installs a real release. No FluxCD.

Configs 07

Config and ConfigTemplate are real CRDs, with a controller and status.

Definition inheritance ALPHA 08

`extends` builds one definition on another. Abstract bases can only be extended.

Definition tests 09

`vela def test` runs CUE unit tests, offline for renders and health.

Scripts and videos

github.com/guidewire-oss/kubecon-na-2026

Alpha features sit behind feature gates that are off by default. Every demo runs on a local k3d cluster and cleans up after itself.
